

Abstract

5 An adhesively mounted angled clamp-like device for producing a compressive force or tensile force includes a frame, at least two plungers arranged at an angle movably connected with the frame, and double-sided stretch releasing adhesive attached to at least one of the frame and the plungers. The frame and/or plungers can be firmly adhesively bonded to a surface or object and later cleanly removed from the frame, plungers, and/or surface without damaging the surface and without leaving adhesive residue by stretching the adhesive.
